

Visual feedback of PROMIS scores in the consultation room

Dutch-Flemish PROMIS National Center
February 2022

- The Dutch-Flemish PROMIS National Center developed visual feedback options for PROMIS scores on item level and domain level
- De feedback options were developed based on literature review, focus groups with health care workers using the KLIK portal¹, and discussions among PROMIS researchers, and with help from an expert in graphical design².

Feedback option

- PROMIS scores will be displayed on item level and domain level
- Responses to individual items will only be presented for the last visit, in a table
- Only responses to items that are completed will be displayed
- T-scores on domain level (based on US parameters) will be presented for all visits, in a figure

Item-level feedback

- Responses to completed items will be displayed in traffic light colors
- Colors will be based on item threshold parameters

General principles

- The presentation of scores is standardized based on color
- Colors always have the same meaning, values (Y-axis, reference lines) can be different across domains

Example graphs

PROMIS Depressie
(PROMIS bank v1.0 - Depressie)

PROMIS Lichamelijk Functioneren
(PROMIS bank v1.2 - Lichamelijk Functioneren)

Scores en hun interpretatie (hogere score = betere gezondheid)

— = gemiddelde score van de Nederlandse bevolking

| = precisie van de score (95% betrouwbaarheidsinterval)

- Graphs show all available T-scores over time, connected with lines
- Y-axes have different scales, but with the same meaning: higher= better (sometimes 0-100, sometimes 100-0)
- Scores are provided with 95% confidence intervals ($1.96 * SE(T\text{-score})$)
- Scores are presented as dots, confidence intervals as thin lines
- Reference line represents the mean score of the Dutch general population per item bank
- In addition, cut-off lines for mild, moderate, and severe problems per item bank are shown (currently $0.5 * SD$, $1 * SD$, $2 * SD$ of the Dutch general population)
- Background color runs from red to green, a color-blind friendly palette has been used)³
- Background is the same in all graphs(reference line is always in the middle), values on the Y-axis shift per domain
- The official name and version of the PROMIS CAT or short form is presented as subtitle to ensure correct reporting in publications
